Although it is necessary, security can take time and money away from your organization's core interests. But you shouldn't have to choose between protection and profit. Security as a Service offers a way out: a disruptive model for regulating the complexity and expense of premium security. It includes at least five critical elements.

1. **Expertise On Demand**
   - You don’t always need to retain specialized security expertise in-house. Keep scarce and skilled resources on a phone call away, especially when you may need different skills in different situations.

2. **Fast, Flexible Deployment**
   - You don’t have to choose between on-premise and cloud deployment. Quickly ramp up and shrink risk even as your organization grows and evolves.

3. **Answers, Not Alerts**
   - You shouldn’t be overwhelmed by meaningless alerts. Identify meaningful threats with sufficient context for rapid remediation.

4. **Efficient Interoperability**
   - You can’t be expected to repeat rip-and-replace strategies. Adopt solutions that fully integrate and centralize the capabilities of your existing security infrastructure.

5. **Community Immunity**
   - You shouldn’t have to go it alone. Build on the awareness and intelligence of your peers in real time to reinforce your security posture and stay current.
