**Ransom Insured**

**MANDIANT IN ACTION**

The FBI is the lead federal agency for investigating cyber attacks, warning organizations about any potential threats as part of their victim notification program.

Often times, FireEye Mandiant Professional Services is who organizations rely on to quickly identify malicious activity and effectively respond.

In this example, a large insurance company activated their Incident Response Retainer after being warned by the FBI about a targeted attack by a known threat actor that deploys ransomware and extorts victims for millions of dollars.

Working directly with the client’s security operations center, the Mandiant team was able to stop the attacker before ransomware was deployed and eradicated the threat until it was confirmed there was no evidence of data theft.

For this engagement, the team effectively performed:
- Host Analysis
- Forensic Analysis
- Network Analysis

**PROBLEM:**
Defending against criminals that are increasingly using ransomware to disrupt business operations and extort victims.

**HOW WE DID IT:**
Deployed Endpoint agents to effectively identify TrickBot malware, perform forensics on accessed systems that had "hands on keyboard" activity and quickly contain the threat.

**HOW WE DID IT better:**
In just 2 weeks, the Mandiant team of experts utilized award winning FireEye Threat Intelligence and technology to identify and contain malware to stop a ransomware attack in flight.

**RESULT:**
The Mandiant team was able to identify the threat and stop the attacker before ransomware was deployed, helping the client prevent any impact to their customers and avoid damaging their brand.
The FireEye Mandiant team spend about 200,000 hours per year working on the most impactful breaches. Here’s a high level walk through of what this 2 week engagement looked like:

**Ransom Insured**

**Eradicating the Threat**

Day 1

- FBI informs client about a potential attack

Day 2

- Client activates IR retainer to engage FireEye Mandiant team

Day 3

- Mandiant Consultants deploy 2500 agents in 4 hours to begin investigation

Day 4

- TrickBot is quarantined, Command & Control (C2) infrastructure used by the attacker is blocked, and Empire is removed

Day 7

- Trickbot malware identified on 100+ systems

Day 14

- Mandiant conducted deep dive forensics on all compromised and accessed systems

- Mandiant determined there was no evidence of data theft and the victim concluded no public disclosure was required.

- Mandiant identified victim zero and initial point of entry.
Ransom Insured

FULL STORY

The FBI is the lead federal agency for investigating cyber attacks by criminals, overseas adversaries, and terrorists. The threat is serious and continues to grow as attackers become better funded and more sophisticated.

Among the groups the FBI has been tracking is a known threat actor that has been extorting dozens of US companies.

Recently, a FireEye Mandiant client was warned by the FBI as part of their victim notification program. The FBI observed that this attacker had hacked into the client and dumped administration credentials from key computer systems.

The client was informed that the attacker was likely to deploy ransomware in less than one week, or as early as 72 hours. They immediately activated their Incident Response Retainer with FireEye and called for assistance.

Within 4 hours, Mandiant Consultants worked with the client to deploy an agent to 2,500 systems to begin investigating.

The Mandiant incident response team quickly identified Trickbot malware had been deployed on 100+ systems where the attacker was using PowerShell Empire as a backdoor, and ProcDump to dump passwords on multiple systems. The Mandiant team immediately began working on a containment plan. On Day 4, the Mandiant team executed the containment plan, where:

- TrickBot was quarantined,
- Command & Control (C2) infrastructure used by the attacker was blocked,
- Empire was removed.

Mandiant consultants continued to investigate and were able to identify victim zero and the initial point of entry. The team discovered that a vendor the client was using had been previously compromised. The attacker had used the vendor’s email account to launch a targeted spear phishing attack using weaponized attachments.

While the ransomware attack was avoided, the insurance company was still concerned about whether there was any data theft and if there were reporting obligations under the breach notification laws.

The Mandiant team performed deep dive forensics on all systems that had been compromised and accessed. Mandiant leveraged the FireEye Labs Advanced Reverse Engineering (FLARE) team to reverse engineer the attacker malware to understand its capabilities.

Mandiant determined there was no evidence of data theft and the victim concluded no public disclosure was required. The swift response of the Mandiant Services team helped prevent any impact to the client’s customers and avoid any damage their brand.

During this two week engagement, Mandiant effectively accomplished the following:

Day 1: The FBI warns the insurance company as part of their victim notification program.

Day 2: The insurance activates R Retainer with FireEye. Within 4 hours, Mandiant and the victim deploy an endpoint agent to 2,500 systems and begin the investigation.

Day 3: Trickbot malware is identified on 100+ systems. Mandiant identified the attacker was using PowerShell begins working on containment plan.

Day 4: Execution of the containment plan. TrickBot is quarantined.

Day 7: Mandiant identified victim zero and initial point of entry.

Day 8-14: Mandiant conducted deep dive forensics on all compromised and accessed systems determined there was no evidence of data theft and the victim concluded no public disclosure was required.
